In Ground:

1. Choose the ideal location for the plant type. Prepare the planting hole twice the size of the root ball. Incorporate soil amendments or organic matter.
2. Gently remove the plant from container by pressing the sides of the pot firmly to release the soil. Carefully loosen some of the outermost roots. (*If your plant was delivered with a stake we do not recommend removing it for 1-2 years until plant is established.*)
3. Place plant in hole, making sure top of the root ball is even with the existing soil line. Backfill soil around the plant and press in firmly to remove any air pockets.
4. Water the area gently but generously to help the soil settle. Fertilize as needed.

In Container:

1. Select a pot/container twice the size of the root ball. Containers should have holes in the base for drainage.
2. Follow steps 2-4 of 'In Ground' instructions.

Note: Plants may drop leaves during and after transplant. This is normal, no need to panic.
