

# HOW TO CLEAN YOUR PLANTER

## *you will need...*

warm water

sponge/cloth

soft bristle brush

spray bottle

Never use products that contain acids or alkaline as these may damage the surface.

Clean the surface by using warm water and non-abrasive colorfast towel when necessary to remove dirt and grime.

Always use water when wiping a spill or you may force a potential stain deeper into the surface.

If the product's surface is soiled, clean immediately for best results. Wash the area with clean water. Do not use chemical cleaners on finish. They may stain or corrode the surface.

If it still doesn't come off, use a soft bristle brush and lightly scrub it then wipe it off.
