

How to Care for a Early Sunrise Large-Flowered Tickseed Plant

Coreopsis grandiflora 'Early Sunrise

SELECT SITE:

Light Requirements: Full Sun (more than 6 hrs/day).

This perennial will grow larger; space 24 in. away from other plants and/or structures.

Thrives in poor sandy or rocky soils with good drainage; easy to grow in average, well drained soil.

Garden Uses: Perennial garden, naturalized gardens, very pretty in groups.

Ideal USDA Plant Hardiness Zones: 4,5,6,7,8

PLANT PREP:

Open box upon arrival, remove packing materials to let the plant "breathe". Remove plastic bag, tape, and newspaper. Water well. There are drainage holes in the bottom of the pot so do this outside where the extra water will drain away.

HOLE PREP:

Dig saucer shaped hole. The depth is determined by measuring the height of the roots from root flare to bottom. The width is 2-3 times the root ball diameter. Using these calculations, the ideal hole for the new bush will be approximately 10" tall by 24" wide.

PLANTING:

Put garden soil in a wheelbarrow or on a tarp. Mix the garden soil with equal amounts of mulch, peat moss, and potting soil. Place plant in hole and adjust for aesthetics. Hold in place while adding more soil, until the hole is completely filled. Push soil down until firm. Do not plant the shrub deeper than it has already been growing. Water well immediately after planting. Mulch evenly to a depth of 2-3 inches being sure to stay at least 4" away from its trunk.

FUTURE MAINTENANCE:

Regularly remove spent flowers to encourage repeat bloom. Consider cutting back to basal foliage if plants become unsightly as summer progresses but definitely at the end of its bloom period. If desired, fertilize in spring when new growth begins. Apply 2 tbsp. of an all-purpose slow release fertilizer upon the ground in a band around the plant at least 6" away from its stems.
