

HOW TO USE THE SQUARE D™ EDITION OF THE SENSE APP WITH SQUARE D CONNECTED DEVICES

1. Go to Settings > My Home > Connected Devices, and enable the integration for Wiser Home devices.
2. Once you click *Enable*, you will need to enter the credentials of your Wiser Home account.
3. Once enabled, it will take a few minutes for the Square D Edition of the Sense app to add your new smart plug devices to your device list.
4. Once added, these devices will function like any other device in the app. The added bonus is that you will also be able to control the device (turning it on/off) right from the Square D Edition of the Sense app, by tapping the on/off button (shown on both the device list or detailed device view).
5. For any smart plug device, you will see a "What's plugged in?" option in *Device Details* (iOS and Android only). We encourage you to answer this, so that you can better categorize the device, help the app learn, and also ensure that you do not have any duplicate devices (in cases where you have a device on a smart plug that the app has already detected). You can specify one of three different options on the "What's plugged in?" screen.

1. Assign the smart plug to an already detected device. This merges smart plug data with identified device.
 2. Assign the smart plug to a new device and specify what that device is. This treats the smart plug as an individual device.
 3. Assign to a power strip that has many different devices on it. This treats the smart plug as a composite device. If any of these devices have been detected previously, select them from the "*Sense Detected Devices*" list below. Historical data from these devices will be merged with the new power strip device.
6. You can control the frequency of timeline notifications and bubble behavior of smart plug devices with the *Standby* feature.

If you are experiencing strange or incorrect wattage numbers, please check to make sure your smart plugs have the latest firmware. You can do this via your Square D Wiser Home app.
