ENGLISH

TROUBLESHOOTING

Common Product Questions

How do I unclog the ice dispenser chute? Eliminate the frost of ice fragments by removing the ice bin and clearing the chute with a plastic utensil. Dispensing cubed ice can also help prevent frost or ice fragment buildup.

Make sure that the refrigerator doors are closed before attempting to dispense ice.

Why are ice crystals and frost forming on my frozen food?

When the doors are opened often or for long periods of time, warm, humid air enters the compartment. This raises the temperature and moisture level within the compartment. Increased moisture will lead to frost and condensation. To lessen the effect, reduce the frequency and duration of door openings. How long will it take for my ice bin to fill completely?

Once the ice supply in the bin has been completely exhausted, it may take up to 90 minutes before additional ice is available, and approximately 72 hours to completely refill the bin.

Why does my ice and water taste unusual?

It is recommended that you replace the water filter:

- Approximately every 6 months.
- When the water fi lter indicator turns on.
- When the water dispenser output decreases.
- When the ice cubes are smaller than normal.

If your refrigerator was recently installed, dispense 2.5 gallons of water (flush for approximately 5 minutes) to remove trapped air and contaminants from the system. Do not dispense the entire 2.5 gallon amount continuously. Depress and release the dispenser pad for cycles of 30 seconds ON and 60 seconds OFF.

Noises You Might Hear

Noise	Possible Causes	Solutions
Clicking	The defrost control will click when the automatic defrost cycle begins and ends. The thermostat control (or refrigerator control on some models) will also click when cycling on and off.	Normal Operation
Rattling	Rattling noises may come from the flow of refrigerant, the water line on the back of the unit, or items stored on top of or around the refrigerator. Refrigerator is not resting solidly on the floor.	Normal Operation Floor is weak or uneven or leveling legs need to be adjusted. See the Door
	Refrigerator with linear compressor was jarred while running.	Alignment section. Normal Operation
Whooshing	Evaporator fan motor is circulating air through the refrigerator and freezer compartments.	Normal Operation
	Air is being forced over the condenser by the condenser fan.	Normal Operation
Gurgling	Refrigerant flowing through the cooling system.	Normal Operation
Popping	Contraction and expansion of the inside walls due to changes in temperature.	Normal Operation
Sizzling	Water dripping on the defrost heater during a defrost cycle.	Normal Operation
Vibrating	If the side or back of the refrigerator	To eliminate the noise, make sure that the sides and back cannot vibrate against any wall or cabinet.
Dripping	Water running into the drain pan during the defrost cycle.	Normal Operation
Pulsating or high-pitched sound	Your refrigerator is designed to run more efficiently to keep your food items at the desired temperature. The high efficiency compressor may cause your new refrigerator to run longer than your old one, but it is still more energy efficient than previous models. While the refrigerator is running, it is normal to hear a pulsating or high- pitched sound.	Normal Operation

Before Calling for Service

	contact a plumber or install a booster pump to compensate for the low pressure.
	completely. Infrequent use of the dispenser. The delivery chute is clogged with frost or ice fragments. The dispenser display is locked. Ice bin is empty. Water filter has been exhausted. Reverse osmosis filtration system is used. Low house water supply

Ice & Water

Possible Causes	Solutions
New installation or water line recently connected.	Dispense 2.5 gallons of water (flush for approximately 5 minutes) to remove trapped air and contaminants from the system. Do not dispense the entire 2.5 gallon amount continuously. Depress and release the dispenser pad for cycles of 30 seconds ON and 60 seconds OFF.
The dispenser panel is locked.	Press and hold the Lock button for three seconds to unlock the control panel and dispenser.
Refrigerator or freezer doors are not closed properly.	Water will not dispense if any of the refrigerator doors are left open.
Water filter has been recently removed or replaced.	After the water filter is replaced, dispense 2.5 gallons of water (flush for approximately 5 minutes) to remove trapped air and contaminants from the system. Do not dispense the entire 2.5 gallon amount continuously. Depress and release the dispenser pad for cycles of 30 seconds ON and 60 seconds OFF.
Tubing connecting refrigerator to house supply valve is kinked.	The tubing can kink when the refrigerator is moved during installation or cleaning resulting in reduced water flow. Straighten or repair the water supply line and arrange it to prevent future kinks.
The house water supply is not connected, the valve is not turned on fully, or the valve is clogged.	Connect the refrigerator to the water supply and turn the water shutoff valve fully open. If the problem persists, it may be necessary to contact a plumber.
Refrigerator was recently installed.	Allow 24 hours after installation for the water storage tank to cool completely.
The water dispenser has been used recently and the storage tank was exhausted.	Depending on your specific model, the water storage capacity will range from approximately 20 to 30 oz.
Dispenser has not been used for several hours.	If the dispenser has not been used for several hours, the first glass dispensed may be warm. Discard the first 10 oz.
Refrigerator is connected to the hot water supply.	Make sure that the refrigerator is connected to a cold water pipe. WARNING: Connecting the refrigerator to a hot water line may damage the icemaker.
	New installation or water line recently connected. The dispenser panel is locked. Refrigerator or freezer doors are not closed properly. Water filter has been recently removed or replaced. Tubing connecting refrigerator to house supply valve is kinked. The house water supply is not connected, the valve is not turned on fully, or the valve is clogged. Refrigerator was recently installed. The water dispenser has been used recently and the storage tank was exhausted. Dispenser has not been used for several hours. Refrigerator is connected to the hot
