

PRODUCT INSTRUCTIONS

External PVC Coupling

FORMUFIT PVC External Couplings can joint two (2) segments of PVC pipe and can be used to extend shorter PVC pipe into longer lengths. To connect this product to PVC pipe, follow the instructions shown below.

Assembly

	
<p>Slip a segment of PVC pipe inside the end of one socket on the External Coupler.</p>	<p>Push or tap into place until the pipe hits the stop inside of the socket. Repeat for the opposite side to connect two pipe segments.</p>

Securing

For permanent and strong connections, it is recommended to use PVC cement/solvent to attach the PVC pipe and External PVC Couplers.

You can also temporarily connect this coupler by driving a self-tapping screw where the pipe and coupler meet, or apply electrical tape over the end of the pipe before inserting into the coupling for a temporary, yet strong connection.
