

# Installation Instructions for 4 Pack Metal Garden Trellis

## I. Tools Needed

- **Gloves:** Protect your hands from injury during handling and installation.
- **Shovel:** Loosen the soil to facilitate inserting the trellises into the ground.

## II. Pre-installation Preparations

- **Inspect the Products:** Thoroughly examine the four metal trellises for any damage incurred during transportation, such as bent components, chipped paint, or missing parts.
- **Select the Installation Location:** Choose an area with sufficient sunlight and good drainage. Consider the growth habits of plants to ensure the selected location meets their lighting and space requirements. Also, avoid underground pipelines and obstacles.

## III. Installation Steps

- **Prepare the Ground:** Use a shovel to loosen the soil in the selected area to a depth of approximately 10 - 15 cm. This makes it easier to insert the

trellises into the ground and keeps them stable. Remove stones, tree roots, and other debris from the soil.

- . **Install a Single Trellis:** Hold a trellis and vertically insert its bottom into the loosened soil, ensuring the trellis stands upright. Insert it to a depth of about 30 - 40 cm, then gently step on the soil around the trellis with your foot to secure it.

- . **Combined Installation:** Combine multiple trellises according to your garden design. You can install them side by side to form a long flower wall or arrange them in a square to create an enclosed plant space. Use wire or gardening straps to connect the tops and middles of adjacent trellises to enhance stability.
