

Window Valance Measurement Guide

Window Valances can be used separately or used with curtains. You can add layers of valances over curtains to create a designer look or keep it simple with just a valance or valance over blinds. Either way the valance will add character and color to your window creating a visual interest. Here are a few steps to ensure you get the perfect size and look for your window valance.

1. One should measure the length of the window that one will be hanging the valance for. If you see by the below image (blue arrow) one should measure from the curtain bracket to the part of the window one wants the valance to hang to ensure your window top is covered by the valance as desired.
2. Next one should measure the width of the window. Measuring from curtain rod bracket to curtain rod bracket. For Flat, Balloon, and Rod Pocket valances one wants to measure from curtain rod to rod creating a fitted tailored look but if one wants a more gathered/ruffled designer look one could double the width of the window to create that fullness.
3. Note that it is easiest to hang a window valance with two people. Once you have the measurements complete and valances purchased now you are ready to hang. Depending on your valance, will depend on how to hang the valance on the curtain rod.
 - a. For a Tie Valance simply tie the valance on the rod with either a bow or knot look depending on your style preference.
 - b. For a Balloon and Curtain Rod Pocket Valances one will need to remove the curtain rod and insert the rod through the rod pocket on the valance. Then rehang the rod back up over the window. Be sure the valance back is facing the wall.

After your valance is hung do not forget your little finishing touches to ensure it is laying, gathered, and hanging in the proper fashion, in order to obtain the look you are desiring.
