How to plant and care for your houseplant

1. Upon arrival, carefully remove your plant from the shipping box and water.

2. Pick a room for your plant to live in, near a window with filtered, indirect sunlight.

3. Use a container that is suitable to the mature height and width of your houseplant, with proper drainage holes and a tray underneath.

4. Fill the container with potting soil about halfway.

5. Flip the plant upside down and gently remove the pot by pulling it up and away from the root ball. Recycle the pot.

6. Place plant into new pot and fill with loose soil until the top of the root ball is level with the top of the container.

7. Feed your plant with a water-soluble fertilizer, repeating once a month. Water the plant generously.

8. Monitor the growth of your houseplant. Maintain moist soil, fertilize and enjoy!

TIPS FOR SUCCESS

Growing results may vary by region.

Watering: Sufficient watering is a must! Water once a week or when soil appears dry. Water thoroughly so it reaches the tray underneath. Most houseplants require that the soil dries out between watering but never allow it to become completely dry. Overwatering can be as damaging as under-watering. Be sure your container has adequate drainage holes to avoid standing water.

Pruning: Houseplants rarely need pruning. However, any dead, damaged or unsightly growth can be removed as needed to maintain an attractive appearance. Often, plants outgrow their containers and need to be repotted into another larger container to promote further growth.

Winterizing: All houseplants should remain indoors during the cold Winter months. Some plants can be moved outdoors in shaded areas during Summer months.
