EASY STEPS FOR
TURF IMPROVEMENT

PREPARE HOLES

Mow existing lawn close to the ground and water thoroughly. Dig holes 18” on center, 3” deep.

FERTILIZE

Apply 1 tsp. of quality slow release fertilizer in each hole. This fertilizer acts like a booster to prime and repair the trouble spot in advance of plugging.

PLANT PLUGS

Press firmly into the fertilizer primed hole with NO air space around edges. Turf runners should be flush to the ground.

WATER PLUGS

After area has been plugged and fertilized, water thoroughly to remove air pockets for optimal performance.

POST PLUG CARE

Thoroughly watering EVERY DAY is the key to plugging success! Keep soil moist at least 6” to 8” deep. Once plugs are rooted (10-20 days), new runners should appear. Decrease watering to twice per week.
