The dimensions provided above are approximate and given for guidance only.
 THE CUTTING OF COUNTERTOP MUST BE DONE BY A PROFESSIONAL INSTALLER.

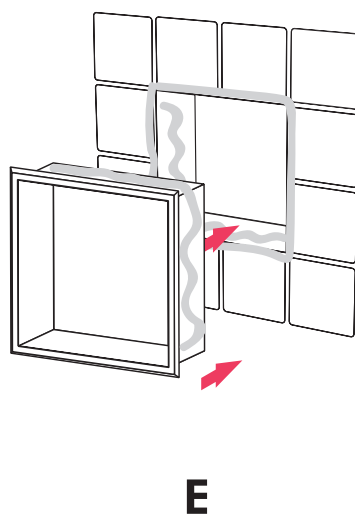

1**2****3**

- Prepare an opening between the uprights according to the dimensions X and Y of your niche minus 6 mm (1/4 inch). Ideally, when you insert the niche, it should offer a little resistance in the gypsum to prevent it from moving until the silicone dries completely. If you have added another ceramic style finish, make it finish slightly shorter than the gypsum.

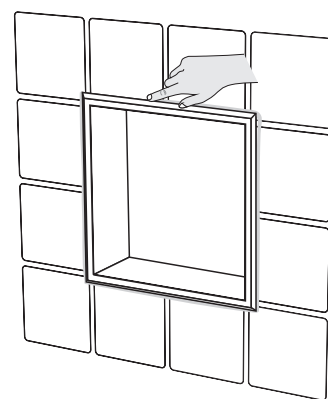

- You will need to install wall supports all around the niche (A) in order to support it adequately.

4

- Generously apply silicone on all sides, on the inner surface of the edge of the niche, on the wall and on the uprights (as illustrated) for optimal sealing and support.

5

- Place the niche against the wall and press firmly. Remove the niche and add silicone if it does not protrude slightly.

6

- With a wet finger, wipe off any excess silicone.
