

Biohort products require little care due to the high quality material and the careful processing. It is sufficient if the lock and the hinges are oiled annually and the sliding guides of the StoreMax are regularly cleaned or treated with silicone spray. In case of contamination due to weather and environmental influences, you only need water for cleaning.

You can even use a high-pressure cleaner for cleaning (distance between the lance and the paint min. 10 cm, do not use a steam cleaner, maximum pressure approx. 80 bar). For the preservation of the paint surface we recommend the Biohort CleanLine preservation, which protects the paint surface best from weather and environmental influences.

**Important:** Salt water and / or sand containing ambient air, aggressive and abrasive cleaning agents, road salt, fertilizers and other chemical substances (never store products openly) can attack the paint and zinc surface and lead to rust damage. Warranty claims can no longer be asserted in such cases.
