

# PLANTER USAGE

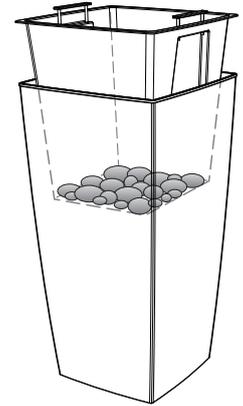

---

## DRAINAGE

The planter's removable inner pot allows for versatile planting. The base features four raised nodes that can be easily pierced or drilled to provide drainage. Create holes based on your plant's drainage requirements. Water will drain through to the larger outer pot and can be easily poured out when needed.

Alternatively, instead of drilling holes, place a layer of large pebbles or stones at the base of the removable inner pot before adding soil. This will allow water to seep through the soil and remain separated from the roots while still providing moisture.

---

## STABILITY

The lightweight design of the planters allows for easy transporting, convenient cleaning, and regular restyling. However, should the planters be placed outdoors or in a position of frequent traffic, we recommend adding large stones (up to 4-inch height) inside the base of the outer pot for additional stability. The weight of the stones inside the outer pot will help counterbalance the weight from the soil in the inner pot, so the planter is not top-heavy.
