

SunPatiens[®] Use and Care Manual

- Favor sun or part sun.
- The ground must drain well and have a lot of humus.
- Plant mulch will retain water and slowly convert to humus over the season.
- Plant several specimens together, spaced about 16 inches (40 cm) from the next to create a nice cover.
- Mix your earth with flower plant soil mix and water often in summer to make the flower-bearing abundant.
- Medium Water - Overwatering will lead to elongated stems with less flowers. The best time to water is when the medium has dried up slightly, just enough to make the leaves sag or wilt a little bit. This shows that the plant is focusing its energy on root development which is important.
