

ZEROSLIP™

Proprietary Anti-Slip Technology

Through extensive research, testing, and development, MSI's porcelain and natural stone pavers are engineered with **ZERO**SLIP technology!

These pavers are where safety and beauty meet. Not only do the porcelain pavers deliver the look of natural stone, marble, metal, but both porcelain and natural stone pavers from MSI provide peace of mind when it comes to safety. This proprietary technology offers exceptional slip-resistance, ensuring a dynamic coefficient of friction (DCOF) value of at least 50% greater than the industry standard of 0.42 and far exceeds the DCOF of many of the most popular pavers on the market.

HOW IS SLIP RESISTANCE DETERMINED?

DCOF, or dynamic coefficient of friction, is a measurement that determines how much friction there is on wet, level floors when walked upon.

The results of DCOF testing help MSI determine the likelihood of whether a tile surface could contribute to someone slipping and/or falling.
